

The same ablation on a covariate-rich and a univariate benchmark

Bars right of zero: removing the component costs accuracy. Full model 4.73 % on GEFCom2014, 5.46 % on AEMO; error bars are the pooled standard deviation over five seeds.

With five seeds the study resolves effects of roughly 0.2 pp, so only the bars whose length exceeds their own error bar are distinguishable from noise — and neither decomposition stage is among them, on either benchmark.
